**Abstract**. In this paper a generalized product of summability is introduced in order to make an advanced study on the special topic of summability. In addition, employing that product we establish a new theorem regarding to summability of Fourier series.

## 1. Introduction and Known Results

Let f(t) be a periodic function with period  $2\pi$  and integrable over the interval  $(-\pi, \pi)$  in the sense of Lebesgue. Let

$$f(t) \sim \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nt + b_n \sin nt)$$
 (1.1)

be its Fourier series.

For two sequences of real or complex numbers  $p = \{p_n\}$  and  $q = \{q_n\}$ , let

$$P_n = p_0 + p_1 + p_2 + \dots + p_n = \sum_{\nu=0}^n p_{\nu}, \text{ for all } n,$$
$$Q_n = q_0 + q_1 + q_2 + \dots + q_n = \sum_{\nu=0}^n q_{\nu}, \text{ for all } n,$$

and let the convolution  $(p * q)_n$  be defined by

$$R_n := (p * q)_n := \sum_{\nu=0}^n p_{\nu} q_{n-\nu}.$$
